

# Multiplicity dependence of $J/\psi$ yield

Yongsun Kim  
Di-lepton meeting

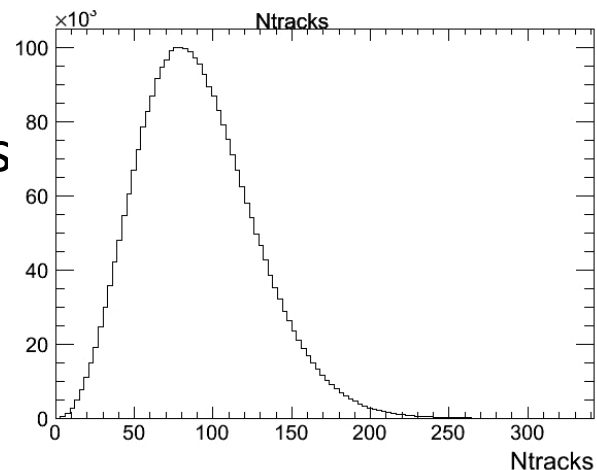

12-Feb-14

# Outline

- Studied  $N_{\text{track}}$  dependence of  $dN/dp_T$  and  $R_{\text{FB}}$

- Events are divided into 5  $N_{\text{track}}$  bins  
{60 – 80 – 100 – 120 – 150}

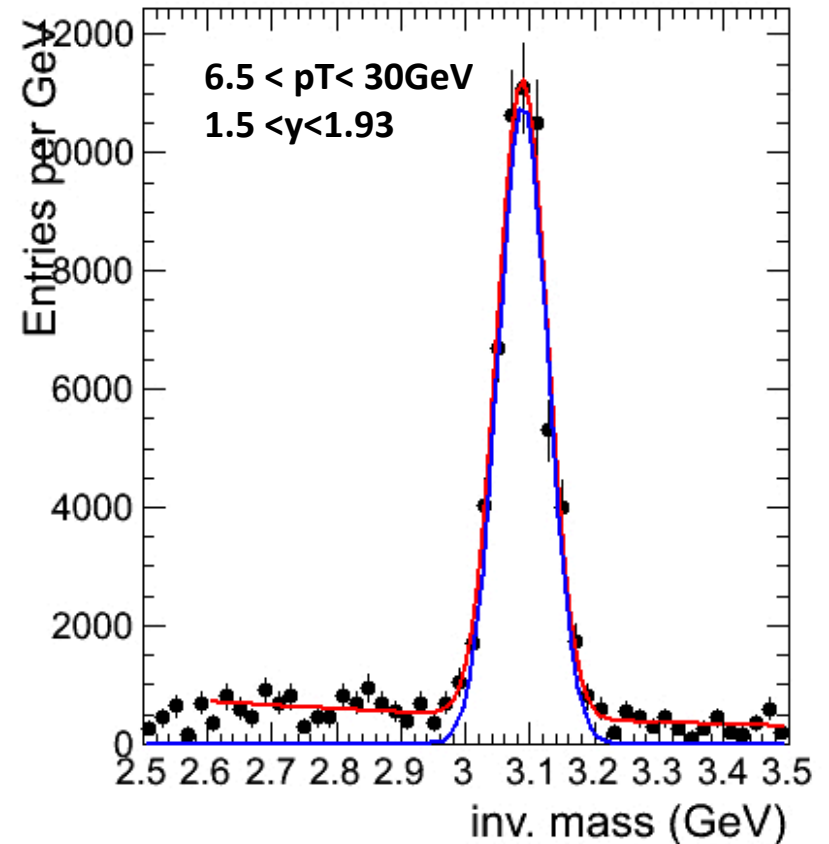

- For the sake of quickness
  - Inclusive  $J/\psi$  yield was extracted
  - Efficiency, Acceptance is not corrected.
  - Gaussian function was used for fitting (Likelihood)
  - Same event+trigger selection,  $p_T$  and rapidity binning are identical to the common setup (<https://twiki.cern.ch/twiki/bin/viewauth/CMS/PAcharm2013>)

# Gaussian Fitting example

Lowest  $N^{\text{trk}}$  bin  
 $N^{\text{trk}} < 60$

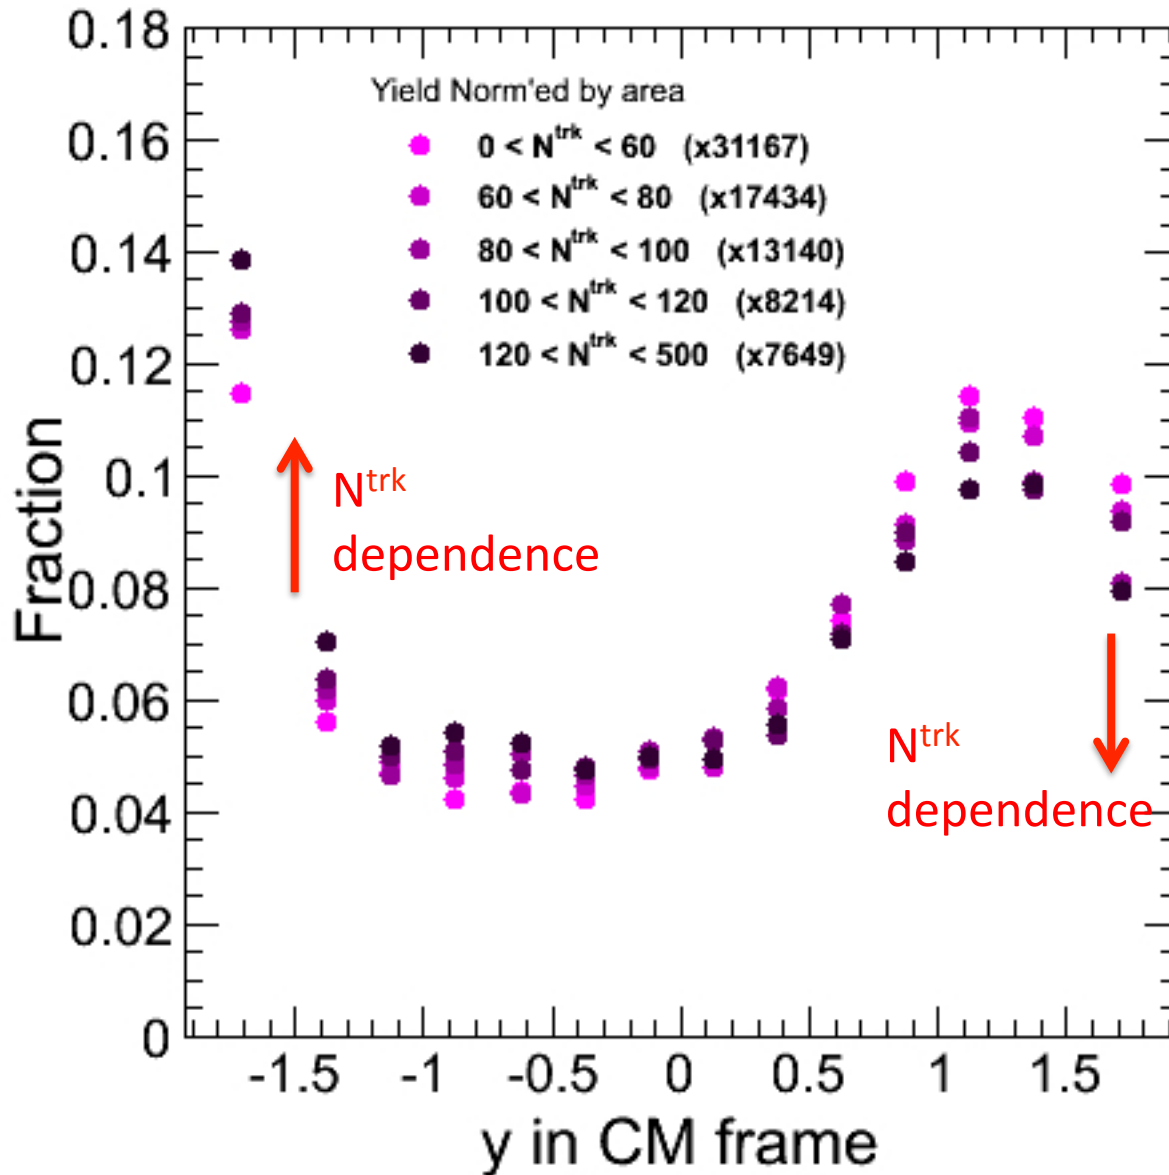

Highest  $N^{\text{trk}}$  bin  
 $N^{\text{trk}} > 120$

- Exponential function used for background fit
- Rest of fitting plots can be found in the backup slides

# Rapidity dependence of yield

Each histograms is normalized by its area

Bigger asymmetry observed in the higher  $N^{\text{trk}}$  bin

# $R_{FB}$ VS $N^{trk}$

Individual curves are not meaningful because eff\*Acc correction is not applied yet.

But, overall trend indicates that the  $R_{FB}$  will be smaller for high multiplicity events.

# Double Ratio

Yield divided by ( $N_{\text{trk}} < 60\text{GeV}$  value)

Eff and Acc are cancelled out for this double ratio value.

Linear Fit was tried to extract the slope of the modification.

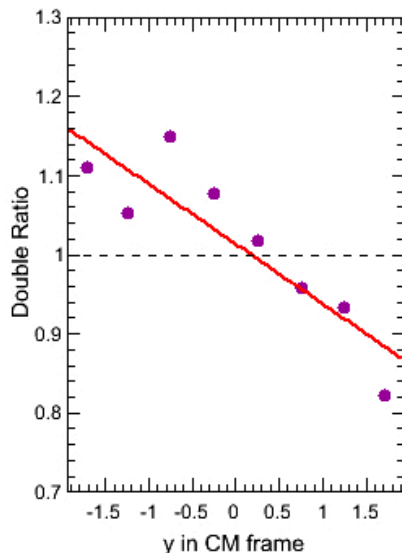

In the highest  $N_{\text{trk}}$  bin,  $R_{\text{FB}}$  differs by up to 20%.

60 <  $N_{\text{trk}} < 80$   
Ntrk < 60

80 <  $N_{\text{trk}} < 100$   
Ntrk < 60

100 <  $N_{\text{trk}} < 120$   
Ntrk < 60

Ntrk > 120  
Ntrk < 60

# Summary and Plan

- Summary
  - $N^{\text{trk}}$  dependence of  $J/\psi$   $R_{\text{FB}}$  was investigated.
  - Several corrections and fine tunings are missing but the results strongly indicates that  $R_{\text{FB}}$  curve is modified by the multiplicity
- Plan
  - Application of Acc and Eff correction
  - Separation of prompt and non-prompt  $J/\psi$  using 2-d fitting (on-going)
  - Investigation of the bias by  $N^{\text{trk}}$  on the muon efficiency
  - Cross-check with HF energy binning
- (pT dependence study?)
  - Tried by dividing into 3 pT bins (6.5 – 8.5 – 11GeV – 30GeV) to investigate the pT dependence.
  - Could not find a clear pT dependence yet. ( See Backup slides)

# BACKUP

# Low pT : pT 6.5 – 8.5 GeV

# Mid pT : pT 8.5 – 11 GeV

# High $p_T$ : 11GeV – 30GeV
