

What is going on in SpiRIT-Collaboration

- Layer > 90 created momentum shift to higher momentum.
- Fitting with GENFIT require PID hypothesis. To do this
 - Simulation was done to draw PID line.
 - Fit [keV/mm] to [ADC/mm] conversion factor by cocktail beam.
 - Sort out PID from first trial of GENFIT caculation. Do GENFIT task again.

Result

- Low limit of pion energy is ~ 50 MeV. Looks like this is track finding and statistical limit.
