## Hanul Meeting

Feb 19, 2019

# G4 Model

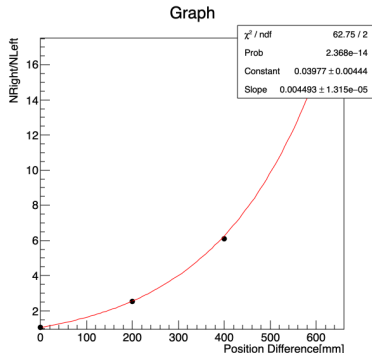

- Scintillation property is set to EJ 230
- 4 sides of Scintillator is covered by Al mylar and black sheet(without gap)
- 2 mppc sides have black sheet only.
- Q.E. of mppc is not considered.
- Due to the scintillation model of G4, timing cannot be measured.(Decays exponentially, without rising time.)
- Number of reflection is constrained up to 200.
- G4 Model is symmetric.

# G4 Attenuation result

- Attenuation length is set to 1200 mm.
- Size of the error bar is very small
- Effective attenuation length is 281 mm. (Due to reflectivity?)

# Attenuation length $\rightarrow$ 600 mm

- Effective attenuation length decreased to 220 mm.
- Attenuation seems to be dominated by reflectivity.
- By adding gap between scintillator and mylar, dependence might be reduced.

# Other works

- Simmulate with shorter/  $\infty$  attenuation
- MPPC callibration @KU with RooFit
- Hososcope@ KU: ~20,000 cosmic evt are expected to be taken by this week.

# Backup

Path length and #Rfl of 120 cm simulation.

# At Center

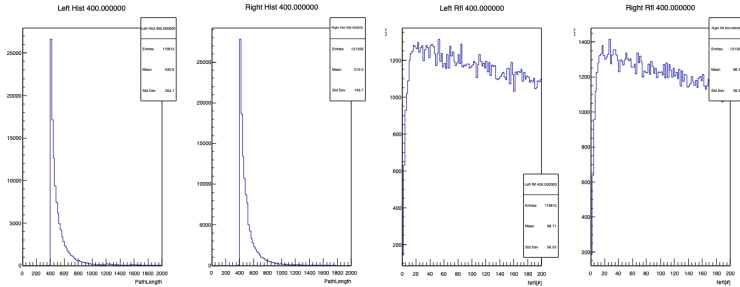

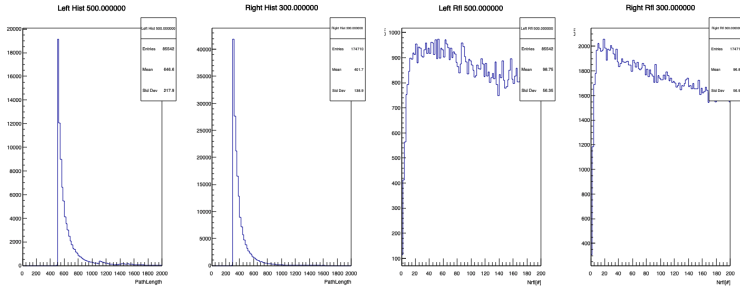

Figure: #Rfl constraint should be increased

# Center +10 cm

# Center + 20 cm

# Center + 30 cm
